1.1.1 Simple Machines - Pltw. As this was the first simple machine, it was difficult to answer some questions, as we had questions of our own on the placement of weights and design of the levers themselves. However, through observation and occasionally trial and error, our group managed to procure tangible results from the simple machines.

Overcoming the resistance force is easy with a screw because it is a combination of two simple machines, allowing rotational energy to be translated into linear motion. A screw is made up of an inclined plane and wheel and axle. Reflection: This last project was easy with help from other groups, as we had to improvise when not all parts were given.

No machine is 100% efficient. A wheel is a lever arm fixed to a shaft, called an axle. The wheel and axle move together as a simple lever to lift or move an item by rolling. It is important to know which is applying the effort and resistance force –wheel or axle.
